The protein comprises a first CC binding to two sites of its target protein. The protein comprises a first CC binding domain capable of binding domain strain site on the target protein, a second binding domain capable of forming neutralising complex with an induced epitope of the target protein and a linker connecting the CC binding domains. sCD4-SCFv(17b) comprises a soluble CD4 fragment CC containing domains D1 and D2) fused to a single chain Fv portion of CC antibody 17b via a linker. sCD4-SCFv(17b), its variant, analogue or CC mimetic is used for inactivating gpl20 protein of HIV, and for CC neutralising HIV. It is also used for blocking and preventing the binding CC of the viral or recombinant gpl20 protein to soluble CD4 or lymphocyte CC therefore useful for treating HIV infection and also AIDS. It is are CC particularly useful in the prevention of infection during or immediately after HIV exposure (e.g., mother/infant transmission, post-exposure CC particularly useful in the prevention of infection and for providing long term CC prophylaxis, and as a topical inhibitor) and for providing long term CC prophylaxis, and as a topical inhibitor) and for providing long term CC resistance to HIV infections and AIDS. Gene therapy is used to secrete the bispecific protein at mucosal surfaces, such as the vaginal, rectal cor oral mucosa. The fusion proteins is highly potent, broadly cross-cC mediated undesirable targetting properties. When the fusion protein is constantially derived from human proteins, it has minimal immunogenicity and not cariff in humans which so great value in prevention of infection of during or immediately after HIV exposure
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an immunogenic complex comprising gp120 covalently bonded to a CD4 equivalent molecule, fragment of CD4 or its equivalent. The invention also relates to a composition comprising the complex and a carrier, an antibody reactive with the complex, an immortalised cell line that produces the complex, a method of detecting the HIV antigen in a test fluid, involving contacting the test fluid with an antibody raised against the immunogenic complex and detecting the presence of immune complexes formed between the antigen in the test fluid and the antibody, and a vaccine comprising an immunogenically effective amount of the immunogenic complex. The immunogenic complex is useful for raising neutralising antibodies against HIV, which involves administering the complex to a subject in a carrier, and for treating HIV infections.

The fusion proteins contain an oligomerisation domain that enables the proteins to bind to one another to form oligomers. The oligomers may be used in an invention relating to a method for screening for compounds with the ability to inhibit a low affinity receptor-ligand interaction. The method uses an interfacial optical assay, such as surface plasmon resonance (SPR). The method is useful for screening candidate compounds for the ability to inhibit interaction between MHC/peptide complex and T cell receptor, and MHC/peptide complex and CD8 or CD4 co-receptor. The compounds identified by the above methods which interfere with T cell receptor binding to a particular HLA type molecule are useful as immune inhibitors for treating carcinomas, autoimmune diseases such as multiple sclerosis, human immunodeficiency virus (HIV) infection, rheumatoid arthritis, Hashimoto's disease, insulin dependent

The PCR product was ligated to an Xbai-Sali fragment containing the sequence encoding lysosomal membrane protein (LAMP-2) (PCR amplified from a hum liver lambda gp10 library using primers AAQ38756 and AAQ38757). The resulting fusion sequence sCD4-L2 can be used to interfere with the normal function of HIV and to direct the virus to lysosomes. (Updated 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New fusion protein used in gene therapy for treating AIDS - comprises protein which binds to retroviral envelope protein which targets fusion protein to lysosome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               misc_feature

CC compositions of the invention have been transduced with a vector that encodes comparises CD4+ cells that have been transduced with a vector that encodes condoplasmic reticulum (ER). The invention also encompasses the use of a cC soluble protein factor produced by CD4+ cells that have been transduced cC with a vector encoding a chimeric CD4 protein; and the use of an CC expression system encoding a chimeric CD4 protein. The ER-localised CC chimeric CD4 molecule binds to the HIV-1 envelope protein gp160, CC resulting in HIV-1 retention in the ER and thereby preventing viral CC replication. In a specific embodiment, the chimeric CD4 molecule CC comprises CD4 fused to 15 amino acids of the C-terminal domain of the TC cell receptor CD3epsilon chain; this chimeric CD4 molecule is designated CC CD4epsilon15 (ADA44807). A known chimeric CD4 of similar structure but CC compositions of the invention have an in trans effect on the replication CC HIV-1, and may be used to treat and prevent HIV-1 infection. The CC consecution is specifically claimed for use in compositions of the invention and prevent HIV-1 infection. The CC chaepsilon15, which is specifically claimed for use in compositions of the invention. The invention relates to a composition for the treatment or prevention of human immunodeficiency virus-1 (HIV-1) infection. The composition

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Primers P-1 and P-2 (AAQ38748 and AAQ38749) were used to amplify an Ecol-XbaI fragment of plasmid pT4B containing the sCD4 sequence. The PCR product was ligated to an XbaI-SalI fragment containing the sequence encoding human acid phosphatase (HAP) lysosomal targeting protein (PCR amplified from a human liver lambda gp10 library using primers AAQ38752 and AAQ38753). The resulting fusion sequence sCD4-HAP can be used to interfere with the normal function of HIV and to direct the virus to lysosomes. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                protein

```

The present sequence is that of DNA encoding fusion protein CD4Mmu (see CAAB19509) comprising the extracellular portion of CD4, which binds to HIV gpl20, linked at its C-terminus to a human IgM heavy chain polypeptide. To obtain the construct, DNA encoding CD4 was linked to IgM DNA at the Mst2 site upstream of the CH1 region. A plasmid containing this genetic construct is deposited in Escherichia coli MC1061/P3 as ATCC 67609. This in protein CD4Mmu and a nucleic acid encoding it are claimed. Also claimed are a vector comprising the nucleic acid, and a method of producing the fusion protein in secreted form using a transformed host cell. The fusion protein may further comprise a therapeutic agent, radiolabel or NMR imaging agent. The fusion protein can be administered to an animal (including humans) for treatment of HIV or SIV infection, and can also be used in assays for HIV or SIV, imaging and tissue stains. If IgM fusion proteins such as CD4Mmu provide complement-mediated immunity NIV, imaging and tissue stains. complement-mediated immunity (see

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes a novel nucleic acid (I) encoding a fusion protein comprising a DNA sequence encoding amino acids 1-173 of CD4 (II) and a DNA sequence encoding a human immunoglobulin (Ig) heavy or light chain (III). The products pf the invention have anti-human immunodeficiency virus (HIV) activity and are capable of binding to gpl20. The fusion protein is useful for treating human immunodeficiency virus (HIV) or simian immunodeficiency virus (HIV) or simian immunodeficiency virus (SIV). This sequence encodes the fusion protein CD4Mg which is constructed from CD4 linked to human IgM upstream of the CH1 region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 1714 BP; 411 A; 503 C; 467

The fusion protein is capable of being secreted. The fusion proteins are useful for treating HIV or SIV infections in animals, preferably humans. They are also useful for producing medicaments which can be used for treating HIV or SIV infections in humans. The present sequence represents the DNA which encodes the fusion protein CD4Mmu where the CD4 is linked to human IgG1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        HIV; extracellular; CD4; gp120; immunoglobulin; Ig; secreted protein; SIV infection; medicament; ds.

New antisense oligonucleotides useful for treating e.g. pulmonary vasoconstruction, inflammation, allergies, asthma, hypertension, bronchitis, emphysema, respiratory distress syndrome, ischemia or

Disclosure; Page 1245; 1343pp; English

The present invention describes a new composition comprising an antisense oligonuclectide (ON) with low adenosine (up to 15%), which targets nucleic acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiinflammatory, antiallergic, antiasthmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation, impaired already, including lung diseases and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating e.g. ischaemic conditions, pulmonary vasconstriction, allergies, asthma, e.g. ischaemic conditions, pulmonary vasconstriction, allergies, asthma, impeded respiration, respiratory distress syndrome, pain,

The reduction of the adenosine content of the ONs reduces side effects. The A-containing ONs break down with the release of deoxyadenosine which activates adenosine receptors causing bronchoconstriction and inflammation. AAA32313 to AAA35312 represent the nucleotide sequences given in the sequence listing from the present invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185 sequences are also called SEQ ID NO:1 to 185, but the sequences differ from the previously named sequences. SEQ ID NO:11 to 1680 (AAA32323 to AAA33929) are specifically claimed ONs from the present invention. N.B. Sequences given in the disclosure of the present invention do not match up with their corresponding SEQ ID NO: sequences given in the sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 1742 BP; 405 A; 492 C; 466 G; 379 T; 0 U; 0 Other;

Low adenosine (A) content antisense oli adenosine receptors during metabolism, and respiratory obstructions. oligonucleotides which do not trigger sm, useful e.g. for treating cancers

Page 1329; 1592pp; English.

CC immunosuppressive, antiasthmatic, hypotensive and cytostatic activities.

CC The antisense oligonucleotides and (I) can be used to down-regulate the CC expression and or activity of target polypeptides associated with CC lung/respiratory disorders and malignancies, such as stimulating and activating peptide factors and transmitters, transcription factors, C immunoglobulins and antibodies, antibody receptors, cytokines and cchemokines, endogenously produced specific and non-specific enzymes, C binding proteins, adhesion molecules and their receptors, cytokine and CC chemokines receptors, adenosine receptors, bradykinin receptors, central nervous system peptide receptors, brinding proteins and peripheral nervous and non-nervous system peptide cransmitters, defensins, growth factors, vasoactive peptides and creceptors, brinding proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction and/or lung inflammation, allergy(ies) and/or surfactant hypoproduction which are associated with a disease or condition selected from pulmonary vasoconstriction, allergies, asthma, impeded respiratory distress syndrome (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary conduction, and/or listress syndrome, conduction, pulmonary infections, bronchitis, and/or cancer. AAF18434 to AAF21543 represent human polynucleotide fromention of the present invention of The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense oligonucleotides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator, antiinflammatory, analgesic, (I) can have respiratory, bronchodilator, antiinflammatory, analgesic,

An antibody for the treatment or prevention of HIV-infection comprises gp120 portion which binds to DC-SIGN or is exposed upon gp120 binding of DC-SIGN due to concomitant conformational change.
                                                                                                                                                                   WPI; 2001-602565/68

The specification describes an antibody which is specific for an antigenic fragment of gpl20. This antigenic fragment binds to DC-SIGN or is exposed upon gpl20 binding of DC-SIGN due to concomitant conformational change. DC-SIGN is a receptor that is specifically expressed on dendritic cells and facilitates infection of T lymphocytes with HIV. DC-SIGN is identical to a HIV-1 gpl20-binding C-type lectin. DC-SIGN binds ICAM-3 (which is expressed constitutively on T lymphocytes) with high affinity. The antibody of the invention inhibits the trans enhancement of HIV entry into a T cell or macrophage facilitated by dendritic cells. The antibody is useful to treat or prevent HIV infection. The present sequence represents a human polynucleotide, which is used in the course of the invention g

                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonucleotide antisense to the cinitiation codon, coding region, 5' or 3' end genomic flanking regions, CC initiation codon, coding regions, or regions within 2-10 nucleotides of Junctions of genes encoding a polypeptide associated with lung and/or coding a polypeptide associated with lung and/or constant airway dysfunction and a second active agent comprising an CC antiinflammatory, antiallergic, antiasthmatic, hypotensive, and cytostatic activity. The composition may have a cuse in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also conformation the prophylactic or therapeutic respiratory effect of an antisense gene therapy. The acomposition or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine content in a subject, for respiratory of bully levels of subfaction bronchodilation, increasing levels of bully lungone or application as subject, for respiratory of bully lungone or construction.
                                                                                                                                             Query Match

condition,

altered expression of genes in an immunological response or for diagnosing and treating an immunopathology, e.g. Crohn's disease, asthma or osteoarthritis. Claim 1; SEQ ID NO 1013; 50pp; English

CC hybridisation complexes with the level of hybridisation complexes with the level of hybridisation complexes with the level of hybridisation complexes correlates with the presence of the detected comprising in a mon-diseased sample, where an altered level of the detected hybridisation complexes correlates with the presence of an comprising a microarray and a plurality of detectable complexes and a comprising a microarray and a plurality of polynucleotide probes. The cDNAs compression of target polynurality of polynucleotide probes. The cDNAs complexes of an immunopathology, such as Crohn's disease, asthma, confidentifying a plurality of polynucleotide probes. The cDNAs confidentifying a plurality of polynucleotide probes. The cDNAs confidentifying agents for the treatment of the diseases, asthma, consecutive colitis, hypereosinophilia, irritable bowel syndrome, confidentifying agents for the treatment of the diseases. The microarray may consist on the diseases of an drug discovery and development, toxicological and consecutive studies, forensics or pharmacogenomics. The composition consecution of a subpopulation of mRNAs, cDNAs or consecution. Note: The sequence represents a human cDNA of the composition of the printed specification but was obtained in electronic format directly consecutive and secution but was obtained in electronic format directly are consecutive. The invention relates to a composition comprising a plurality of cDNAs for detecting the altered expression of genes in an immunological response. The invention also relates to a method of diagnosing or monitoring the treatment of an immunopathological condition in a sample, comprising obtaining nucleic acids from a sample, contacting the nucleic acids of the sample with an array comprising the plurality of cDNAs under conditions to form one or more hybridisation complexes, detecting the USPTO at seqdata.uspto.gov/sequence.html. under
